

INTRODUCTION

This is an enhanced port of Genesis Plus, an open-source & portable Sega Mega Drive / Genesis emulator, now also emulating SG-1000, Master System, Game Gear and Sega CD /Mega-CD on Gamecube and Wii, through [libogc & devkitPPC](#).

The source code, originally based on Genesis Plus 1.2.a by [Charles MacDonald](#), has been heavily modified, with respect to initial goals and design, in order to improve accuracy of emulation, implementing new features and adding support for new peripherals, cartridges & systems hardware.

The result is that Genesis Plus GX is now more a continuation of the original project than a simple port, providing very accurate emulation and 100% compatibility with Genesis / Mega Drive, Sega CD / Mega-CD, Master System, Game Gear & SG-1000 game libraries (including all known unlicensed or pirate games dumped), also emulating backwards compatibility modes when available.

Last but not least, it comes with plenty of exciting features and options that have nothing to envy to your most favorite PC emulators and makes this emulator the most faithful experience for any Sega 8/16-bit fans.

FEATURES

Very accurate & full speed 8-bit / 16-bit emulation

- accurate emulation of SG-1000, Mark-III, Master System (I & II), Game Gear, Genesis / Mega Drive, Sega CD / Mega-CD hardware models (incl. backwards compatibility modes)
- NTSC (60Hz) & PAL (50Hz) video hardware emulation
- highly accurate 68000 & Z80 CPU emulation
- highly accurate VDP emulation (all rendering modes, mid-line changes, undocumented registers,...) & timings (HBLANK, DMA, FIFO, HV interrupts,...)
- sample-accurate YM2612, YM2413, SN76489, & RF5C164 PCM sound chips emulation
- cycle-accurate sound chips synchronization with 68000/Z80 CPU
- cycle-accurate 68000 & Z80 CPU synchronization
- optimized Main-CPU / Sub-CPU synchronization (Sega CD/Mega-CD)
- accurate CDD, CDC & GFX chip emulation (Sega CD/Mega-CD)
- accurate CD-DA fader emulation (Sega CD/Mega-CD)
- Mode 1 cartridge support (Sega CD/Mega-CD)
- Audio CD, CD+G and CD-ROM Mode 2 support (Sega CD/Mega-CD)
- high-quality audio resampling using Blip Buffer
- basic hardware latency emulation (VDP/68k, Z80/68k)
- full overscan area emulation (horizontal & vertical color borders)
- optional Game Gear extended screen mode
- optional Game Gear LCD ghosting filter
- optional Blargg's NTSC filters

- optional BOOT ROM support (Master System, Game Gear, Genesis / Mega Drive)
- optional TMSS hardware emulation (Genesis / Mega Drive)
- preliminary PICO emulation
- support for raw (.bin, .gen, .md, .sms, .gg & .sg) and interleaved (.smd & .mdx) ROM files
- support for various CD image file formats (CUE+BIN, ISO+WAV & ISO+OGG, CHD)
- support for subcodes external files (.SUB)

Support for various input peripherals

- 2-buttons, 3-buttons & 6-buttons Control Pads
- Sega Team Player & EA 4-Way Play multitaps
- Master Tap
- Sega Mouse
- Sega Paddle Control
- Sega Sports Pad
- Sega Graphics Board
- Terebi Oekaki tablet
- Sega Light Phaser
- Sega Menacer
- Konami Justifiers
- Sega Activator
- XE-1AP analog controller

Support for various cartridge extra hardware

- SVP DSP (Virtua Racing)
- J-Card adapter (Micro Machines & Pete Sampras series, Super Skidmarks)
- Backup RAM (max. 64KB)
- I2C (24Cxx), SPI (95xxx) & MicroWire (93C46) EEPROMs
- 512KB RAM cart (Sega CD / Mega-CD)
- “official” ROM bankswitch hardware (Super Street Fighter 2)
- “official” backup RAM bankswitch hardware (Phantasy Star 4, Legend of Thor, Sonic the Hedgehog 3)
- Everdrive extended SSF mapper
- MegaSD specific mappers and CD hardware overlay
- all known unlicensed/pirate cartridges bankswitch & copy protection hardware
- all known Master System & Game Gear cartridge “mappers” (incl. unlicensed Korean ones)
- basic emulation of Flashkit MD hardware
- Game Genie & Action Replay hardware emulation
- Sonic & Knuckles “Lock-On” hardware emulation
- support for ROM image up to 10MB (Ultimate MK3 hack)

Game Cube & Wii common features

- fully featured & optimized Graphical User Interface
- 48 kHz stereo sound
- optimized GX video rendering engine
- perfect audio/video/input synchronization
- 50/60 Hz video output support
- original low-resolution video modes support (interlaced & non-interlaced)
- high-resolution interlaced (480i/576i) & progressive (480p) video modes support
- hardware bilinear filtering
- configurable BIOS & Lock-on ROM files
- configurable sound mixer (FM/PSG levels) and filtering (Low-Pass filter & 3-Band equalizer)
- configurable NTSC filter
- optional MONO audio output mixing mode
- independently configurable region mode, VDP mode & Master Clock
- 1~4 Players support
- automatic Backup RAM and State files loading/saving
- automatic game files loading
- game files loading history
- load files from SD/SDHC or DVD

- support for zipped ROM files
- game internal header information display
- internal game screenshots
- Game Genie & Pro Action Replay cheat codes support through .pat files
- cartridge "hot-swap" mode
- automatic disc swap detection
- configurable CPU overclock

Wii additional features

- support for ROM image up to 15MB (Demons of Asteborg)
- up to 8 Players support
- Wiimote, Nunchuk & Classic controllers support
- Wiimote IR support & calibration for light gun emulation
- Wii U Pro Controller support
- USB mouse support for mouse emulation
- USB drive support (IOS58 is required for USB2)
- configurable hardware "Trap" filter & Gamma correction
- "Wiiflow" plugin compatibility

RUN THE EMULATOR

- **genplus_cube.dol** is the application running in Game Cube mode. It can be loaded on a Game Cube by using various methods: see http://www.gc-linux.org/wiki/Getting_Started#Booting_Code for more details.
- **genplus_wii.dol** is the application running in Wii mode. The easiest way to run the emulator on a Wii is to install the [Homebrew Channel](#). Once you are done, simply copy the /apps directory (included with this release) and its content to the root of your SD card or USB drive. There are other ways to run dol files on the Wii like building a dedicated channel or using an alternate DOL loader. Feel free to visit <http://www.wiibrew.org> for additional information.

SETUP THE EMULATOR

Genesis Plus GX supports Mega Drive / Genesis, Master System, Game Gear & SG-1000 ROM files as well as Sega CD / Mega-CD image files. Supported extension formats are .cue, .chd, .iso, .bin, .gen, .md, .mdx, .smd, .sms, .gg and .sg. Compressed .zip files are also supported (for ROM files only) as long as they contain a single file in one of the supported format.

Sega CD / Mega-CD emulation setup

CD BOOT ROM images (also generally called "**BIOS**") are required for each console region: the emulator expects BOOTROM files to be respectively named **BIOS_CD_J.bin**, **BIOS_CD_U.bin** and **BIOS_CD_E.bin** and placed in **/genplus/bios/** directory on the default FAT device. It should not matter what versions you are using but some CD games might be incompatible with latter BIOS revisions. For best compatibility, Model 1 BOOTROM image files should be used.

You can also manually select the BOOT ROM file for each region by going to the System Settings under the emulator options menu.

To play a game, you first need to load a file from one of the following supported devices: DVD, SD card or USB drive (Wii only).

There is a limit of **1000 files** shown per directory so it's strongly advised to create subdirectories. Reducing the number of files per directory also improves menu interface speed and usability.

FROM SD CARD

The SD card should be formatted to FAT (FAT16 or FAT32). If not found, the emulator automatically creates a directory named **"/genplus"** at the root of your SD card, as well as subdirectories required by the emulator to store miscellaneous files (cheat, save & screenshot files). By default, the emulator will look for files in the **sd:/genplus/roms** directory but you can place them anywhere you want, the menu keeping trace of the last accessed directory for each device.

FROM USB DRIVE (Wii only)

The USB drive should have at least one partition formatted to FAT (FAT16 or FAT32), other file systems (NTFS, EXT2, etc) are not supported. If no SD card is inserted when the emulator starts, it automatically creates a directory named **"/genplus"** at the root of your USB drive partition, as well as subdirectories required by the emulator to store miscellaneous files (cheat, save & screenshot files). By default, the emulator will look for files in the **usb:/genplus/roms** directory but you can place them anywhere you want, the menu keeping trace of the last accessed directory for each device and for each file types.

To use an **USB2 drive**, you must have **IOS58** installed (it should be automatically installed with System Menu 4.3 update). You should also load the emulator through the Homebrew Channel, using the provided meta.xml file and make sure Homebrew Channel is using IOS58 as default IOS. If not, you might need to reinstall Homebrew Channel after having installed IOS58.

DVD

The DVD should be formatted using ISO9660/Joliet (refer to the user manual of your DVD Burning software for more details). The Game Cube Mini-DVD drive allows up to 1.35GB of data while the Wii DVD drive allows up to 4.7GB of data (simple-layer).

By default, the emulator will look for files at the root of your DVD but you can place them anywhere you want, the menu keeping trace of the last accessed directory for each device and for each file types.

To use DVD on a **non-chipped Wii**, you should load the emulator through the Homebrew Channel and use the provided **meta.xml** file, in order to allow full access to the DVD drive.

USE THE EMULATOR

When you are navigating through the menus, the following keys are used:

Menu Action				
Item selection				
Confirm selection				
Cancel & Previous menu				

After the disclaimer screen, wait for the program to initialize then press the confirm button to enter the main menu.

LOAD GAME

First, you might want to load a new game. Choose the “LOAD GAME” option and enter the next menu, which will present you a new button set:

RECENT let you browse through the recently loaded files. This list is constantly updated when you load new game files from SD, USB or DVD. This way you can have faster access to your favorite and last played games.

The **default storage device** can be changed through the **Menu Settings**: the last accessed directory will automatically be saved for each storage device types and for each game types.

MASTER SYSTEM let you browse the default storage device for Master System ROM files (.zip, .sms)

GAME GEAR let you browse the default storage device for Game Gear ROM files (.zip, .gg)

SG-1000 let you browse the default storage device for SG-1000 ROM files (.zip, .sg)

MEGA DRIVE let you browse the default storage device for Mega Drive / Genesis ROM files (.zip, .bin, .gen, .md, .smd, .mdx...)

MEGA CD let you browse the default storage device for Sega CD / Mega-CD image files (.cue, .bin, .iso, .chd)

Sega CD / Mega-CD audio tracks

- When using **ISO** image files, **WAV or OGG** files should be provided as AUDIO track files. You can either load a CUE file pointing to a specific ISO file and containing all the needed information about AUDIO tracks files or directly load the ISO file. In the latter case, the emulator will first look for a .CUE file with the same base name, then if no CUE file is found, it will **automatically** look for .WAV or .OGG files using one of the following naming format (“XXX” being the .ISO filename, NN being the track number starting from 02 and “yyy” being either .wav or .ogg extension): “XXXNN.yyy”, “XXX NN.yyy”, “XXX-NN.yyy”, “XXX - NN.yyy” or “XXX_NN.yyy”. Please note that **other compressed audio files** (such as .mp3, .mpc, .wma, etc) are **NOT supported** and audio tracks should be using **16-bit stereo 44100Hz** format.
- When using **BIN** images files, audio tracks are generally stored within the image file. A **CUE** file is therefore required with all the needed information about audio tracks location. You can either load the CUE file pointing to the specific BIN file or directly load the .BIN file. In the latter case, the emulator will automatically look for a CUE file with the same base name as the BIN file.

Sega CD / Mega-CD disc swap

For games with swappable discs, when a disc swap is required, the emulator will **automatically detect** that the “virtual” CD tray has been opened: all you have to do in order to swap discs is to **load another disc image** file through the file browser (as usual) and the system will not be reset, allowing you to continue the game. Please note that some BIOS (e.g. Japanese Model 2 BIOS) might not open the virtual tray when a disc swap is required: if disc swap does not work for you (i.e. resets the game instead of swapping discs), try with another BIOS. On Wii exclusively, the DVD light will glow when the virtual CD tray is opened to indicate disc image swap is possible.

Pick one of the buttons to enter the next menu, which is actually the file browser, specific to the selected game type:

On the left side, you can browse the current directory, navigate within subdirectories or select a game file to load, by using the normal navigation buttons. You can also use the following buttons to perform special actions, specific to this menu:

Game Cube Controller

-  exit file selection menu
-  or  go up one full page
-  or  go down one full page

Wii Remote

-  exit file selection menu
-  or  go up one full page
-  or  go down one full page

Classic Controller

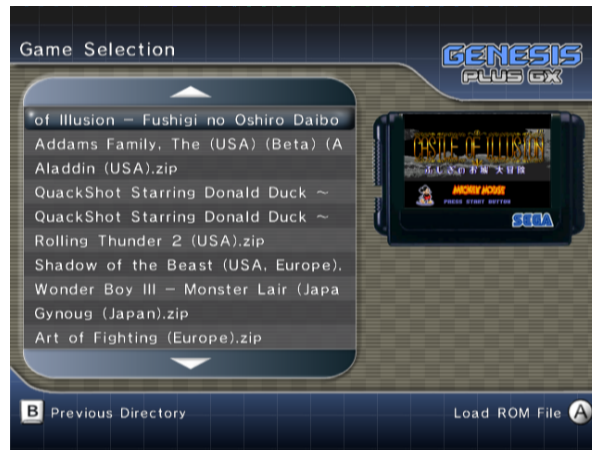

-  exit file selection menu
-  or  or  go up one full page
-  or  or  go down one full page

On the right side, a snapshot of the currently selected game will be displayed, if it exists. Game screenshots should be put in the **/genplus/snaps/** directory on your default FAT device and in their default subdirectories:

- **/cd** for Sega CD / Mega-CD image files
- **/md** for Genesis& Mega Drive ROM files

- **/ms** for Master System ROM files
- **/gg** for Game Gear ROM files
- **/sg** for SG-1000 ROM files

Screenshot files should be PNG files in RGBA8 format (32-bit per pixel): to make things easier, the emulator has an internal screenshot feature, which can be accessed from the main menu, once a game has been started (please refer to Main Menu description in further section for more details).

Once you have highlighted the game you want to play, press the Confirm button to load it. If everything went fine, the emulator automatically closes the menu and starts playing the game.

SOFT RESET

While playing a game, you can simulate the behavior of the original console RESET button by pressing the RESET button on your Gamecube / Wii console or hitting the RESET button in Main Menu. Please note that this only works with console hardware that actually implemented a RESET button (i.e it only works when Mega Drive / Genesis or Master System 1 hardware models are emulated). For other systems that did not have a RESET button, this acts like switching OFF then ON the Power Button of the emulated console.

MAIN MENU

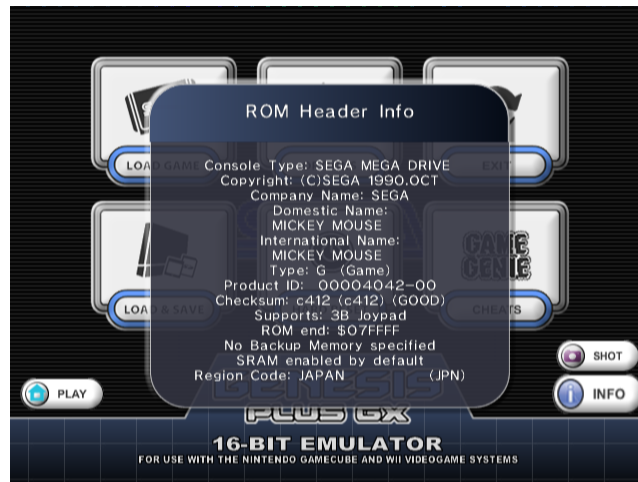

Once a game has been started, you can switch back to the main menu anytime you want by moving the **right analog stick** (if not used by emulated device) or  and  simultaneously on Gamecube controllers,  on Wii controllers.

It's possible to map an alternate menu key combo in Controller settings for each configured Gamecube or Wii controller.

From the main menu, the following options are immediately accessible:

- Return to the game by pressing  PLAY /  PLAY
- Display ROM header information about the game by pressing 

- Save a screenshot of the game by pressing 
- Only when Action Replay “Lock-On” emulation has been enabled through the System Settings (refer to the Option section below for more information), you can change the Action Replay switch position, just like with a real Action Replay cartridge:

Cheat Codes enabled

Cheat Codes disabled

Trainer Mode activated (PRO Action Replay only)

You have also the possibility to load another game by returning to the **LOAD GAME** menu or enter one of the other menus described hereafter.

EMULATOR OPTIONS

In order to offer the most enjoyable and customizable experience for every users, the emulator let you configure various different settings, which are classified in five categories.

SYSTEM Settings

System let you force the emulated console hardware:

- **AUTO:** hardware model is automatically detected using game file extension, file header or internal game database when loading a new game. The default console hardware association for supported ROM file extensions are the following:
 - SG-1000 hardware is automatically selected for .sg ROM files (except for a few games present in database that are only fully compatible with SG-1000 II clone hardware or SG-1000 hardware with 8KB RAM extension cartridge adapter).
 - Master System 2 hardware is automatically selected for .sms ROM files (except for a few games present in database that are only fully compatible with Mark III or original Master System hardware and some demos that uses Genesis backward compatibility features).
 - Game Gear hardware is automatically selected for .gg ROM files. A few games present in database are using Game Gear backwards compatibility mode (Master System mode).
 - Sega CD / Mega-CD hardware is automatically enabled when loading a valid CD image file or a ROM image known to be relying on CD hardware (e.g. Flux, Wonder Library)
 - Mega Drive / Genesis hardware is automatically selected for other ROM files.
- **SG-1000:** SG-1000 hardware emulation is forced (only compatible with .SG-1000 ROM files).
- **SG-1000 II:** SG-1000 II clone hardware emulation is forced (similar to SG-1000 hardware except it uses 2KB RAM and an integrated VDP+PSG chip).
- **SG-1000 + RAM EXT.:** SG-1000 hardware emulation with 8KB RAM extension cartridge adapter is forced (compatible with SG-1000 ROM files but also Master System ones which exclusively use TMS video modes, for example, this can be used to play MSX ports with original TMS99xx chip color palette)
- **MARK-III:** Mark III hardware emulation is forced (compatible with SG-1000 and Master System ROM files).
- **MASTER SYSTEM:** Master System (original model) hardware emulation is forced (compatible with SG-1000 & Master System ROM files).
- **MASTER SYSTEM II:** Master System II hardware emulation is forced (compatible with SG-1000 and .Master System ROM files).
- **GAME GEAR:** Game Gear hardware emulation is forced (compatible with SG-1000, Master System & Game Gear ROM files).
- **MEGA DRIVE / GENESIS:** Mega Drive / Genesis hardware emulation is forced (compatible with Master System ROM files, Genesis / Mega Drive ROM files and Sega CD / Mega-CD image files).

When forcing console hardware emulation, the emulator will use **backwards compatibility mode** if possible, depending on file extension. Please note that some games will only work properly on a specific hardware model, so use the AUTO mode if you want best compatibility and forced modes only if you know what you are doing or want to experiment the differences.

Warning: changing this setting while a game is being emulated will reset the game.

Region let you force the region setting for the emulated console:

- **AUTO:** region is automatically detected, through ROM header and internal game database.
- **PAL:** forces PAL region code
- **USA:** forces NTSC-U region code
- **JAPAN:** forces NTSC-J region code

Some games might act differently depending on the selected region setting but also may not run correctly or display an error message on startup if they are region protected.

Warning: changing this setting while a Master System game (only when using System BOOT ROM) or a Sega CD / Mega-CD game is being emulated will reset the game.

VDP Mode let you force emulated hardware TV mode, independently from console region:

- **AUTO:** 50/60hz mode is automatically detected from console region
- **NTSC:** forces NTSC mode (60hz)
- **PAL:** forces PAL mode (50hz)

This option can help make region-protected games running at a **different speed** without changing the hardware region. However, please note that some games might also be **optimized** for a specific TV mode and might not work correctly when forcing an unsupported mode.

System Clock let you select the system clock frequency used for emulation timings:

- **AUTO:** clock frequency is automatically detected from system region
- **NTSC:** 53.693175 MHZ original master clock
- **PAL:** 53.203424 MHZ original master clock

This option is mainly used to emulate accurate **pixel aspect ratio**. When VSYNC is disabled, this option also allows emulation to run at the selected frequency (when VSYNC is enabled, emulation speed is locked to the Wii / Gamecube native refresh rate, which is slightly different from original hardware refresh rate).

System Boot let you select the booting method for emulated system:

- **CART:** boot from loaded cartridge (default)
- **BIOS->CART:** boot from internal BOOT ROM with a cartridge loaded
- **BIOS ONLY:** boot from internal BOOT ROM with no loaded cartridge (no effect when emulating Genesis / Mega Drive hardware)

This option only affects systems using cartridge games and originally having an **internal BOOT ROM** (Genesis / Mega Drive, Game Gear or Master System). Sega CD / Mega-CD hardware is not affected by this option as internal BOOT ROM is required by the system to run and therefore always enabled.

BOOT ROM files should either be selected manually using **BIOS & Lock-On ROM paths** option described below or respectively be named **BIOS_MD.bin**, **BIOS.gg**, **BIOS_U.sms**, **BIOS_J.sms** & **BIOS_E.sms** (one for each supported region) and placed in **/genplus/bios/** directory on the default FAT device.

When Genesis / Mega Drive BOOT ROM is enabled, **TMSS lock hardware** is also emulated by default: this was included in later hardware revisions as internal protection against unlicensed games. Please note that this is NOT required to play games and should only be activated if you are nostalgic for the annoying license screen when booting a game.

Warning: changing this setting while a Mega Drive / Genesis or a Master System game is being emulated will reset the game.

System Lockups let you enable/disable emulation of illegal address access. On real hardware, accessing prohibited memory areas would make the software crash or freeze. This should not happen with commercial games but some demos or homebrew games might need this to be disabled.

68k Address Error let you enable/disable emulation of address error exception. On real hardware, accessing misaligned addresses would cause a CPU exception. This exception can be caused by a program to test it is running on real hardware as emulator generally don't handle this properly. This can also cause badly programmed demos or hacks to crash when enabled.

This option only affects Genesis / Mega Drive games.

CD Access Time let you enable/disable simulation of CD hardware latency when initiating a read or seeking a specific location on loaded disc. This is required by a few CD games that crash if CD data is available too soon and also fixes CD audio desync issues in some games. Disabling this can be useful with MSU-MD games as it makes CD audio tracks loops more seamless.",

This option only affects Mega-CD /Sega CD games or Genesis / Mega Drive games when CD Add-on is enabled.

CD Add-on let you enable/disable CD hardware add-on emulation when a cartridge game is loaded. Some cartridge games or hacks indeed have support for Sega CD / Mega-CD hardware, for example to add in-game CD audio playback or make use of Sega CD / Mega-CD additional hardware resources.

This option only affects Genesis / Mega Drive games.

- **AUTO:** This will automatically enable Sega CD / Mega-CD hardware emulation when a Genesis / Mega Drive ROM file (max. 8MB) is loaded and **one** of the following conditions is met:
 - ROM header indicates Sega CD / Mega-CD peripheral is supported (“C” character)
 - or
 - game is known to require Sega CD / Mega-CD peripheral (Flux, Wonder Library,...)
 - or
 - a valid CUE file (AUDIO or DATA CD) with same base name as loaded ROM file is found in same directory as the loaded ROM file

In case MegaSD specific commands (“REM LOOP”, “REM NOLOOP”,...) are found in associated CUE file, MegaSD flashcart CD hardware overlay interface emulation is automatically enabled and Sega CD / Mega-CD hardware is not fully emulated. More precisely, neither the Sub-CPU or CD controller chips are emulated, only CD read/playback functions are emulated.

- **NONE:** This will disable Sega CD / Mega-CD hardware emulation when a Genesis / Mega Drive ROM file is loaded, even when one of the above conditions is met
- **MEGA / SEGA CD:** This will force Sega CD / Mega-CD hardware emulation when a Genesis / Mega Drive ROM file (max. 8MB) is loaded even when none of the above condition is met or when a valid CUE file is found with MegaSD specific commands
- **MEGASD:** This will force MegaSD flashcart CD hardware overlay interface emulation when a Genesis / Mega Drive ROM file (max. 8MB) is loaded, except when
 - ROM header indicates Sega CD / Mega-CD peripheral is supported (“C” character)
 - or
 - game is known to require Sega CD / Mega-CD peripheral (Flux, Wonder Library,...)in which cases complete Sega CD / Mega-CD hardware emulation is instead enabled.

In case a valid CUE file (AUDIO or DATA CD) with same base name as loaded ROM file is found in same directory as the loaded ROM file, the associated disc is automatically loaded.

Otherwise, in case Sega CD / Mega-CD hardware emulation is activated but no valid CUE file is found, the emulator will automatically load a disc if it detects, in same directory as the loaded ROM file:

- a valid Sega CD / Mega-CD ISO file with same base name as loaded ROM file (DATA track only)
 - and (optionally)
- *valid WAV/ OGG files in one of the following naming format (“XXX” being the ROM filename without extension, NN being the track number starting from 01 and “yyy” being either .wav or .ogg extension): “XXXNN.yyy”, “XXX NN.yyy”, “XXX-NN.yyy”, “XXX - NN.yyy” or “XXX_NN.yyy” (AUDIO tracks only)*

Lock-On let you enable/disable cartridge Lock-On emulation. Some special cartridges had an extra connector with the possibility to connect another game cartridge, adding new features to the game. To use lock-on feature, enable one of the supported device below, make sure the ROM image for this device is properly installed then load any games as normal. As long as this option is not disabled, any game you load will be played through the selected “Lock-On” device.

This option only affects Genesis / Mega Drive games.

Warning: changing this setting while a Mega Drive / Genesis game is being emulated will reset the game.

- GAME GENIE:** This emulates internal Game Genie hardware. Please refer to the Game Genie user manual for more details. In order to enable Game Genie emulation, you must provide the Game Genie ROM image by either selecting it manually using **BIOS & Lock-On ROM paths** option described below or putting it as **"ggenie.bin"** in the **"/genplus/lock-on/"** directory, on your default FAT device.

- ACTION REPLAY:** This emulates internal Action Replay or PRO Action Replay hardware (PRO Action Replay 2 is only partially supported). Please refer to the Action Replay or PRO Action Replay user manuals for more details. In order to enable Action Replay or PRO Action Replay emulation, you must provide the ROM image by either selecting it manually using **BIOS & Lock-On ROM paths** option described below or putting it as **"areplay.bin"** in the **"/genplus/lock-on/"** directory, on your default FAT device.

When Action Replay "Lock-On" is enabled and Action Replay software has been detected, you can modify the Action Replay switch position in the Main Menu (see previous section).

It is not mandatory to enable Game Genie or Action Replay "Lock-On" in order to use cheats. You could instead go the **Cheat Menu** and enter cheat codes manually (check later section). This option is there if you want to emulate cheat devices natively and run their original software. For example, using PRO Action Replay software, you can search for your own cheat codes using the "Trainer Mode".

- SONIC & KNUCKLES:** This emulates Lock-On hardware found in the Sonic & Knuckles cartridge. By using this feature, you can connect first Sonic games to the cartridge's pass-through port for extended & modified gameplay. You can also connect any other games and see what happen, just like with a real Sonic & Knuckles cartridge. In order to enable Lock-On emulation, you must provide the Sonic & Knuckles ROM image and, for playing Sonic 2 &

Knuckles, the extra ROM chip (UPMEM) image by either selecting them manually using **BIOS & Lock-On ROM paths** option described below or putting them respectively as “**sk.bin**” and **sk2chip.bin**” in the “/genplus/lock-on/” directory, on your default FAT device.

BIOS & Lock-On ROM paths will let you select the various ROM files that will be used as BIOS (required for Sega CD / Mega-CD), Boot ROM (optional for Master System, Game Gear or Genesis / Mega Drive), Game Genie / (PRO) Action Replay / Lock-On ROMs (optional for / Mega Drive).

Cartridge Swap, when enabled, let you virtually swap any loaded game over the current one, without resetting the emulated console. Use this option only if you know what you are doing, as it can easily crash the game.

Main 68K Overclock let you adjust the speed of the MC68000 CPU used in Genesis / Mega Drive hardware up to 3x the original speed (OFF meaning the CPU is emulated at its original speed). Increasing the emulated CPU speed can improve the animation speed in some games but can also cause games to crash so this option should be used cautiously.

This option has no effect unless Mega Drive / Genesis hardware is emulated.

Sub 68K Overclock let you adjust the speed of the MC68000 CPU used in Sega CD / Mega-CD hardware up to 3x the original speed (OFF meaning the CPU is emulated at its original speed). Increasing the emulated CPU speed can improve the animation speed in some games but can also cause games to crash so this option should be used cautiously.

This option has no effect unless Sega CD / Mega -CD hardware is emulated.

Z80 Overclock let you adjust the speed of the Z80 CPU used in SG-1000, Master System, Game Gear and Genesis / Mega Drive hardware up to 3x the original speed (OFF meaning the CPU is emulated at its original speed). Increasing the emulated CPU speed can improve the animation speed in some games but can also cause games to crash so this option should be used cautiously.

SVP Cycles let you adjust the number of CPU cycles emulated by scan lines for the SVP chip used in Virtua Racing cartridge. Indeed, emulating the SVP requires a lot of additional resources so you can lower the default value if the emulation is too choppy. However, keep in mind that the SVP chip will therefore be running at a slower clock rate, which will result in slower 3D rendering.

This option is only available when Virtua Racing is loaded.

VIDEO Settings

Display let you change the default rendering mode:

- **ORIGINAL** enables original consoles low-resolution modes support: these modes generally output a progressive 240 lines (288 lines for PAL) display. Interlaced modes (240i/288i), as used in Sonic 2 two player's mode for example, are also supported and automatically switched. In this mode, games would look exactly the same as they did on real hardware, giving you the most faithful retro experience. However, this mode might not be compatible with some TVs when using the component cable.
- **INTERLACED** enables Interlaced Video mode (480i/576i) support. In this mode, because of the higher resolution, games generally look better than on the real hardware but some artifacts (motion blur) might appear during fast movements if bilinear filtering is disabled.
- **PROGRESSIVE** enables Progressive Video mode (480p/576p) support. Only use this mode with a component cable and a compatible TV.

TV Mode let you change the default video signal type:

- **50/60 HZ:** in this mode, the emulator automatically switches between 50Hz and 60Hz video signals to match the emulated VDP mode.
- **60 HZ:** in this mode, the emulator forces the display to 60Hz (NTSC or PAL60). Use this if your TV does not support 50Hz.
- **50 HZ:** in this mode, the emulator forces the display to 50Hz (PAL). Use this if your TV does not support 60Hz.

VSYNC let you force emulation synchronization method:

- **AUTO:** VSYNC is enabled if emulated VDP mode (PAL/NTSC) and Wii / Gamecube TV mode (50/60 Hz) are identical, otherwise VSYNC is disabled and emulation is only synchronized with Wii / Gamecube audio hardware.
- **OFF:** VSYNC is always disabled, i.e. emulation is only synchronized with Wii / Gamecube audio hardware.

It is generally better to run with VSYNC enabled when possible since it ensures not a single rendered frame is ever repeated or skipped, while the emulator is designed to remain in **perfect sync** with Audio hardware as well, by emulating audio chips relatively to the Wii / Gamecube output frequency (frame rate). However, if you do not mind video stuttering occurring from time to time and prefer having the emulator running at the exact same rate as original hardware, you might want to disable this option.

Bilinear Filter let you enable/disable Texture hardware bilinear filtering. When enabled, the screen might look a little bit blurrier but it is highly advised to use it in INTERLACED or PROGRESSIVE display modes, since graphic distortions might appear during screen scrolling when disabled.

Deflickering Filter let you enable/disable Framebuffer Hardware vertical filtering. When disabled, the screen might look a little bit crispier but it is highly advised to leave it enabled, since screen flickering might be very noticeable when using INTERLACED display mode (NB: this option has no effect when using ORIGINAL and PROGRESSIVE display modes).

Trap Filter let you enable/disable Video Encoder output filtering. This filter is usually implemented on modern consoles to improve color separation in the "low quality" Composite Video signal and therefore might not have any effect when using S-VIDEO, RGB or Component cables. On older consoles like the Genesis, this property of composite video was used by game developers to create additional "fake" colors on screen and various effects (shade, transparency). By disabling the filter, you can somehow recreate these effects as they were intended to be displayed (but still not exactly since the Wii still outputs a cleaner video signal than your old Genesis).

This option is only available on Wii.

Gamma Correction let you change the default Gamma correction applied by the Video Encoder on the output. Default value is 1.0.

This option is only available on Wii.

LCD Ghosting Filter let you enable/disable/configure software LCD filtering. This filter simulates the persistence of a LCD screen which is required in some Game Gear games to look correct. When enabled, you can configure the strength of persistence effect (max 100 %).

NTSC Filter let you enable/disable NTSC software filtering. This filter emulates the native artifacts produced by the NTSC Video Signal (color blending...). Some games indeed use this effect to simulate additional colors or transparency effects. Please note that this filter is very CPU consuming. Several predefined modes are available (COMPOSITE, S-VIDEO & RGB) which simulates a specific video signal type. MANUAL mode will let you configure filter settings individually (Sharpness, Resolution, Artifacts, Color Bleed, Color Fringing). Please refer to the Blargg NTSC filter online documentation for more details.

Borders let you enable/disable overscan color emulation: when enabled, the background color is displayed around the active screen area, just like on real hardware.

- **ALL:** full overscan area is emulated.
- **H ONLY:** only horizontal borders are emulated.
- **V ONLY:** only vertical borders are emulated.
- **OFF:** overscan emulation is disabled and border color is forced to black.

GG Screen let you enable/disable extended Game Gear screen mode.

- **ORIGINAL:** display original Game Gear LCD screen (160x144 pixels)
- **EXTENDED:** display "full" Game Gear rendered screen (256x192 pixels)

Extended mode only increases the size of the **visible display area** (to match the Master System visible area). Indeed, since both hardware used similar VDP, the **rendered screen** size is the same (256x192 pixels) and in some Game Gear games, this area might still hold part of the screen, normally hidden by the reduced LCD display area (160x144 pixels). For most games however, this part will only display garbage data so this option should be left to ORIGINAL by default.

Aspect let you change the default screen aspect ratio:

- **ORIGINAL (4:3)** mode automatically set the correct aspect ratio, exactly as if you connected a real Genesis / Mega Drive to your TV.
- **ORIGINAL (16:9)** mode is the same as above except it is designed for those having their TV forced in 16:9 mode. The original aspect ratio is preserved by forcing pillar-boxing on both sides of active screen. Please note that since the original width is altered, the image quality will be degraded, especially when filtering is disabled. It's generally better to manually switch your TV in 4:3 mode if it is possible, the TV hardware taking care of pillar-boxing for you.
- **SCALED** mode let you manually adjust horizontal and vertical scaling, using the "Screen Scaling" option below.

Game Gear games can be displayed "full screen" by setting Aspect Ratio to **SCALED** and **disabling borders** completely.

Screen Position let you adjust the screen position while keeping the current aspect ratio. *This option is only effective when a game is currently running.*

Screen Scaling let you adjust the display aspect ratio manually. *This option is only effective in SCALED mode and when a game is currently running.*

AUDIO Settings

Master System FM let you configure YM2413 FM chip emulation on Master System hardware.

- **AUTO:** YM2413 is automatically enabled or disabled using console region & internal game database.
- **OFF:** YM2413 is always disabled
- **ON: YM2413 is always enabled.**

FM chip was normally only available for Japanese Master System & Mark III hardware but a lot of games (even western exclusive ones) have code to use it as additional sound source and it is possible to modify Master System & Mega Drive /Genesis consoles for YM2413 FM chip support.

YM2612 Type let you select the YM2612 FM synthesizer chip model for Genesis / Mega Drive hardware.

- **DISCRETE:** discrete YM2612 chip used in earlier Genesis / Mega Drive models (9-bit DAC with characteristic distortion effects)
- **ASIC:** ASIC-integrated YM2612 chip used in later Genesis / Mega Drive models (improved 9-bit DAC)
- **ENHANCED:** virtual YM2612 chip without original hardware DAC quantization (14-bit DAC)

High-Quality FM, when enabled, FM synthesizer chips output will be resampled to Gamecube & Wii native samplerate (48 kHz) using higher-quality Band-Limited Synthesis. When disabled, sound chips are still running at their native frequency but are resampled using lesser quality (faster) linear interpolation.

High-Quality PSG, when enabled, PSG chip output will be resampled to Gamecube & Wii native samplerate (48 kHz) using higher-quality Band-Limited Synthesis. When disabled, PSG chip is still running at its native frequency but is resampled using lesser quality (faster) linear interpolation.

FM Volume let you adjust the volume ratio of the emulated FM synthesizer chip (0~200%).

PSG Volume let you adjust the volume ratio of the emulated PSG chip (0~200%)

Audio Out let you pick STEREO (default) or MONO output mixing mode.

Filtering let you enable/disable additional output filtering: on real hardware, analog mixing circuitry is naturally filtering the sound output, you can try to reproduce this with a single-pole low-pass filter or with a more complicated 3-Band equalizer.

Low-Pass Rate let you adjust the amount of filtering when Low-Pass Filter is enabled. *This option is only available when Low-Pass filtering is enabled.*

Low / Middle / High Gain let you adjust the gain of each frequency range of the 3-Band equalizer, when it is enabled. *This option is only available when 3-Band equalizer is enabled.*

Low / High Frequency let you adjust the frequency ranges of the 3-Band equalizer, when it is enabled. *This option is only available when 3-Band equalizer is enabled.*

CONTROLLER Settings

In this menu, you can select the type of peripheral you want to connect to each of the two emulated input ports, just like with the real system.

The following peripherals are emulated (with some restrictions that are mentioned below):

	2-BUTTONS / 3-BUTTONS / 6-BUTTONS control pad (automatically detected or forced through player settings)
	Sega MOUSE (only one mouse can be connected at one time)
	Sega MENACER (can only be connected to Port B)
	Konami JUSTIFIERS (can only be connected to Port B, adds 2 controllers)
	XE-1AP (needs at least one analog stick)
	Sega ACTIVATOR (needs two analog sticks, i.e. GameCube or Classic controller)
	Sega LIGHT PHASER
	Sega PADDLE
	Sega SPORTS PAD
	Sega GRAPHIC BOARD
	Sega TEAM PLAYER (each connected device adds 4 controllers).
	EA 4-WAY PLAY (uses both ports, adds 4 controllers).
	Furrtek's MASTER TAP (each connected device adds 4 controllers).
	NOT CONNECTED (might be required in some games to access specific play modes).

When loading a new game, the emulator will **automatically detect** if it **requires** a special device to work fine and configures the ports for you. The previous configuration will be restored when you load a new game with no special device support.

When detecting a game that is known to use **J-CART** hardware, the emulator will automatically connect a normal controller to port B and add 2 additional controllers.

Only connect specific devices if you know the game actually supports them. Refer to the game manual for more information on the supported controllers and how to connect them.

- Games supporting MENACER or JUSTIFIERS light guns require you to connect the gun in port B and a normal controller in port A. In this case, bear in mind that player 2 (and 3 when using Justifiers) will be controlling the light guns.
- Some Genesis / Mega Drive games only work with 3-Buttons Control Pad and will crash or malfunction when 6-Buttons Control Pad are used.
- Most SG-1000, Master System & Game Gear games should remain compatible with 3-Buttons Control Pad but since they were never really designed to support it, some of them might accidentally mess with the device and require 2-Buttons Control Pad to work properly.
- Some multi-player games with SEGA TEAM PLAYER support will require you to connect a normal controller in port A and the multi-tap in port B.

If the game is supporting it, you can have up to 8 simultaneous players by connecting a Sega TEAM PLAYER on each port. You must of course have enough real controllers connected to your system. **For that reason, on Gamecube, there is a maximum of 4 simultaneous players allowed.**

Once you have setup input ports, the number of possible players is automatically updated to match the number of available controllers. You can now select each player and enter the associated controller configuration windows. Depending on the type of emulated device, you will be able to configure device specific option, select the input controller to use in order to emulate it and remap the controller keys.

Gamepad specific options

You can choose to emulate 6-Buttons, 3-Buttons, 2-Buttons Control Pad or let the emulator automatically pick the default controller type depending on the loaded game.

Mouse specific options

You can enable & disable Mouse Y-Axis inversion (required in some games e.g. Populous 2).

Gun specific options

You can enable & disable Gun cursor on-screen display. Most games supporting light guns would render their own cursor on the active screen but some actually doesn't, it should help you figuring where you are aiming at.

Select Input Controller

The emulator automatically detects controllers that are connected to your system and can be used in order to control the emulated peripheral.

The following input controllers are supported:

	GAMECUBE CONTROLLER
	WII REMOTE (horizontally handled) (*)
	WII REMOTE + NUNCHUK (*)
	CLASSIC / WII U PRO CONTROLLER (*)
	WII U GAMEPAD CONTROLLER (**)
	NO DEVICE

(*) only available on Wii or WiiU (vWii)

(**) only available on WiiU (vWii)

When **multiple controllers** of the same type are found, you can select which one you want to use (for example, Wii Remote 1 for Player 1, etc).

If a **Classic Controller** is connected to a Wii remote, it is possible to assign this Wii Remote to Player 2 while the Classic Controller is assigned to Player 1.

Gamecube controllers are automatically assigned depending on the connected port : port 1 is affected to player 1 or 5, port 2 to player 2 or 6, etc...

Configure Keys

Once an input controller is selected, you can configure the key mapping to control the emulated peripheral. In the dialog box, simply press the key you want to use for each specific peripheral button.

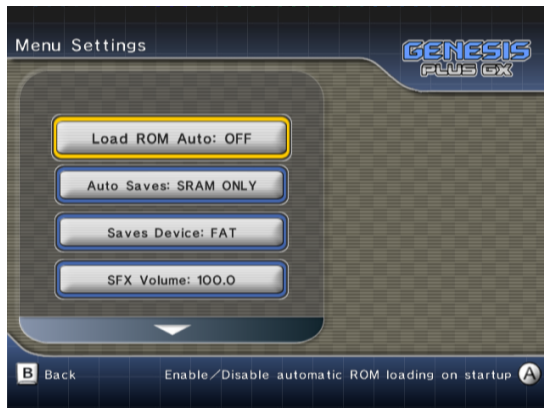

You can exit the dialog box anytime by pressing  when using a Game Cube controller or  when using a Wii controller.

The default key mapping for 3-Buttons & 6-Buttons Control Pad is detailed below:

	D-PAD	START	A	B	C	X	Y	Z	MODE
									
									
									
									

Despite having specific buttons layout, all type of **emulated peripheral** share a common key mapping (i.e. there is one key configuration per **input controller**). When remapping keys of emulated peripheral, you can see which buttons need to be configured but bear in mind that the updated keys configuration will affect other emulated device type when you swap them.

MENU Settings

Auto ROM Load: when enabled, the last played ROM file (first entry of the history.ini file) will automatically be loaded when the emulator is starting and if everything went fine (i.e. the game file has been found), the game will immediately start, without having to go through the Main Menu.

Auto Cheats: when enabled, associated cheat file (if found) will automatically be loaded when you load a new game and cheat codes automatically enabled/disabled according to cheat file content. Cheat codes can be independently enabled / disabled through the Cheats Menu and status is saved in the cheat file.

Auto Saves let you configure which kind of saves you want to be automatically loaded when you load a game. When enabled, the specified file type will be automatically saved when exiting the application or just before loading another game. The following options are available:

- **SRAM only:** if the game has an internal save feature (backup RAM, serial EPROM, etc), data will automatically be saved to a .srm file each time you enter the menu and the game have modified the data. If found, the same .srm file will automatically be loaded when you load the game.
- **STATE only:** this will allow saving and restoring internal state for the game, even if it does not support native saves. A .gpz file will automatically be saved when exiting the game and reloaded (if found) when loading the game.
- **ALL:** this will enable automatic load/save for both types.
- **NONE:** this will completely disable automatic load/save.

You can always use the **SAVE MANAGER** menu to manage SRAM & STATE files for the current game. Refer to SAVE MANAGER menu description below for more information.

Sega CD / Mega-CD internal & external (cartridge) RAM are always automatically loaded when loading a new game, no matter the status of this option. They are also saved each time the Main Menu is entered. If not formatted, they are **automatically reformatted** on startup. You can also format them manually by entering the Sega CD / Mega-CD **Boot Menu** when emulated hardware is reseted (press any button except START when the Sega CD / Mega-CD logo appear to enter the Boot Menu)

Load ROM Device let you configure the default device to use when loading ROM files: SD Card, USB Drive (Wii only) or DVD.

Saves Device let you configure the device to use when loading & saving SRAM & STATE files:

- **FAT:** files are stored in the /genplus/saves directory on the default FAT device. On Wii, when both SD card and USB drive are connected when the emulator starts, SD card will be used as default FAT device.
- **MCARD A:** files will be stored on the memory card inserted in Game Cube slot A.
- **MCARD B:** files will be stored on the memory card inserted in Game Cube slot B.

SFX Volume let you configure the volume of sound effects played in the menu

BGM Volume let you configure the volume of the background music played in the menu.

BGM is only played if you put an appropriate audio file in the **/genplus** directory on the default FAT device and named it **Bg_music.ogg**. Please note that only .ogg files are supported and because of console inner memory limitations, you should use limited size audio files.

BG Overlay let you enable/disable the default menu background overlay.

Screen Width let you configure the default menu screen scaling to fit with your TV.

Show CD Leds let you enable/disable on-screen CD LEDs when playing Sega CD / Mega-CD games. Those LEDs mimic the ones that were on the Sega CD / Mega-CD first model and can give real-time indications about virtual CD drive access / loading times.

Show FPS let you enable/disable on-screen FPS displays. By default, the number of rendered frames per second will be stuck to current frame emulation speed (approx. 50 or 60 fps depending if emulated VDP is in PAL or NTSC mode) but when fast-forward is enabled, you can check how fast the emulator is running without any kind of synchronization (raw emulation speed).

Wiimote Timeout let you configure the delay before the wiimote is automatically turned off when being inactive. Default is 5 MINUTES but it can be configured to 30 MINUTES for games with long cut scenes (Snatcher for example) to prevent the Wiimote from being disconnected.

This option is only available on Wii.

Wiimote Calibration let you recalibrate manually the Wiimote pointer or pick the default calibration.

This option is only available on Wii.

SAVE MANAGER

In this menu you can:

- Manage game saves if the current game originally supports cartridge backup memory. If progress was saved in the game and backup memory modified, a star will be displayed on the left, indicating you should now update the “SRAM” file. If the game does not support internal saves, this item will be disabled.
- Manage up to five different internal states for the current game. By using, this feature, you can save your progress in the game and restore it **anytime you want**, even if the game does not have native saving support.

Select one of the available slots then press the Confirm button to display an additional window:

Load the selected file from the default save device.

Set the selected slot as the default state slot. This slot will be used when automatic state loading/saving is enabled.

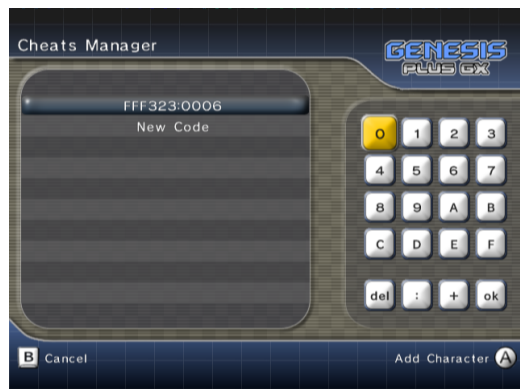

Delete the selected file from the default save device.

Save the selected file to the default save device.

You can configure the emulator to **automatically load & save** SRAM and/or State files, as well as selecting the default device used to store these files. Please refer to the **Menu settings** for more information.

CHEATS MANAGER

In this menu, you can manually add, remove or edit cheat codes for the current game. You can also enter a short description for each code as well as enable or disable a particular cheat.

If **Auto Cheat** option is enabled, cheat codes are automatically loaded when you load a new game, from the associated cheat file (if it exists). Cheat files are automatically saved each time you modify or add codes.

Cheat files are stored as **.pat files** on the default FAT device, in the **/genplus/cheats** directory and their respective subdirectories (**/md** for Genesis / Mega Drive and Sega CD / Mega-CD games, **/ms** for Master System games, **/gg** for Game Gear games and **/sg** for SG-1000 games) and should be exactly named as the game file (minus the extension). PAT files created from other emulators are supported, as long as they have the proper extension and name.

Both **Game Genie** and **Action Replay** code types are supported. Game Genie codes should come in the form of XXXX-YYYY (Mega Drive / Genesis) or XXX-YYY-ZZZ (Master System & Game Gear) while Action Replay codes format is XXXXXX:YYYY (Mega Drive / Genesis and Sega CD / Mega-CD) or 00XXXX:YY (Master System & Game Gear).

The maximal number of cheat codes is 150. If the .pat files you are using have more than **150 codes**, extra codes will be **ignored** and therefore **deleted** when writing the cheat file back. Also note that the length of the cheat description is also limited, a maximum of approximately 64 characters can be displayed.

In the cheat manager menu, the following keys are used:

Menu Action				
Select Cheat				
Display Cheat Code/Description				
Edit Cheat & Enter Digit				
Cancel & Previous menu				
Enable/Disable Code				
Delete Cheat				

FAST FORWARD

When running games, you can accelerate emulation speed (for example to skip through annoying scenes) by holding  (on the first Gamecube controller) or  (on the first Wii remote or classical controller) then pressing  (START button on the first Gamecube controller) or  (on the first Wii remote or classical controller). When fast forward is enabled, emulation is not synced with either audio or video anymore and is running at maximal speed which should be between 2x and 7x (depends on the emulated game & system).

EXIT

Select this in order to view the credits rolling screen or quit the program. Depending on the way you booted the program, you can either return to the loader, return to System Menu (Wii only) or reset the console (Gamecube only).

You can shutdown your Wii console and exit the program anytime (even while playing the game) by

holding  button on the Wii Remote.
